

Sustainable styrenics specialty solutions

Christian Ruthard, Product Manager ECO Specialties EMEA

Chemical resistance, impact strength and aesthetic surface are just a few properties that make styrenics materials the material of choice for a wide range of applications in many industries including automotive, healthcare, construction and many others. The family of styrenics specialties include ABS materials, e.g. offering superior heat resistance, SBC materials, e.g. offering an amazing combination of high transparency and impact resistance, and many other copolymers.

INEOS Styrolution is actively working on making these products sustainable by introducing special recycling methods or exploring renewable feedstock such as bio-attribution. In this presentation, we will give an overview addressing the various innovations having led to first commercially available solutions as well as providing a roadmap to coming solutions.
