

Accelerating SYENSQO's Sustainable Renewable Carbon Strategy

Summary

As an industrial group devoted to sustainable development, SYENSQO is committed to finding new differentiating products and solutions for our customers. Decreasing our energy consumption and carbon footprint is our global ambition. As a chemist, developing new products coming from sustainable renewable resources is also a clear target. However, this should always be performed integrating life cycle analyses, including the applications and the end of life management of our products, to ensure that the highest sustainability standards are met to provide innovative solutions for our customers. Our present topic will be focused on our continuous efforts to replace fossil based products by new solutions starting from sustainable renewable resources and the strategies put in place to accelerate such efforts. This talk is an opportunity to share our industrial view on some development cases highlighting the important issues to be addressed but also opportunities and perspectives for the coming years.
