

Workshop on LCA Methodology for Bio-based, CCU and Recycling

Abstract

DG ENV, European Commission and experts from the nova-Institut will offer a workshop which is dedicated to LCA methodology in the field of renewable carbon. (Biogenic) carbon accounting, EoL allocation and specific data availability will only be some of the aspects that will be addressed.

Mauro Cordella, DG ENV, will focus on three main aspects:

- a comprehensive update on the latest advancements in Environmental Footprint (EF) methods and their use policies.
- Different options for C modelling and account, highlighting pros and cons
- Bio-based materials and products in the EF 4.0 data base.

Nova will emphasize challenges around different available standards and guidelines. In addition, nova will present some aspects on carbon modelling, especially in recycling situations, as well as the topic of electricity in LCA.

After the presentations there will be much time to discuss, ask questions and raise additional aspects.
