

Workshop: Food- and Feed Biomass for the Industry – Conflicts with Food Security?

Hosts: Michael Carus, Lara Dammer (nova-Institute)

There is a widely held view that the use of food and feed crops for anything other than food and feed uses – namely, for bio-based chemicals and materials – is detrimental to food security. We are ready to challenge this perception and want to encourage differentiated discussions and evidence-based opinion making.

In this workshop, nova-Institute will present findings from latest research indicating that the impacts of using food and feed crops are much more complex than usually assumed and can even be positive, with regards to climate, land productivity, environment, farmers' income, market stability, feed security and food security.

Join our workshop for surprising insights and in-depth discussion of a hotly debated issue!

Topics:

- Why bio-based materials have an important role to play for mitigating climate change
- Global biomass availability
- Overall environmental impacts and sustainability assessments
- Economic effects
- Protein supply and emergency reserves
