Title: Renewable Chemicals Market – Navigating Shifting Global Dynamics

Abstract:

The global renewable chemicals market is in the midst of a major shift influenced by geopolitical and macroeconomic uncertainties. In the USA, President Trump's stance on climate change could drive federal policies and funding into a different direction from what was implemented under the Biden-Harris Bioeconomy Initiative. In Europe, the restructuring of the petrochemical industry could present both opportunities and risks for bio-based chemicals investments in the region. This presentation will explore China's rapid expansion in biodegradable plastics production and how this is affecting the global market for bio-based monomers supply.

This presentation will also provide brief updates on several bio-based monomers development and commercialization from 2023 to 2025.
